Three directions on the same content (FR-001a)

A · IDFKIT.COM: NAVY, THE BLUE-VIOLET-RED SWEEP, INTER + JETBRAINS MONO

B · SHOEBOX: A DRAFTING SHEET, GRAPHITE AND A REDLINE PEN, IBM PLEX

C · AUTH.IDFKIT.COM: INDIGO-BLACK, A COPPER ACCENT, INTER + JETBRAINS MONO

What was compared

The same navigation, hero, primary action, card, code block and footer, each set in one host's direction as it stood on 2026-09-11: the marketing site's stylesheet, shoebox's inline tokens, and the sign-in page's tokens.css.

Decision

A, the marketing site's direction, chosen because it is the direction the most-visited host already wears and the one the other two can converge to without losing their content. Shoebox keeps its drafting-sheet layout and language and converges in colour and type (research R9); the sign-in page takes the standard's accent in place of copper.

Costs carried as requirements

White text on the sweep measures under 4:1, so text set on it is moved off it (FR-015, research R8). The direction had no light theme, so one was designed with the accent one step darker, #2563eb at 5.17:1 on white (FR-014).
